

## Press Release 2015-June-02

### Print Tracker Announces Version 7.0 of Print Tracker Pro and Admin

#### Dateline – Boise, Idaho, USA

Continuing the upward momentum, Print Tracker is proud to announce its newest software versions, Print Tracker Pro and Admin 7.0.

Print Tracker has recently strengthened its collaboration with imaging device manufacturers Brother International Corporation and Samsung Electronics and continues to add support for new devices from all sources as they come to market. Print Tracker continues to serve customers on six continents.

“Enhancing our collaboration with manufacturers helps all our customers. Our robust, thorough library is something we are very proud of,” said Print Tracker President Lance Hale. “All improvements and enhancements made over the past eleven years are combined in Print Tracker 7.0,” Hale added. “We gather more meter and supply counters from more devices than competitive offerings.”

Print Tracker 7.0 operates on Microsoft platforms 2003 through current releases including Windows 10. The software provides enhanced response handling for counters gathered from SNMP versions 1, 2 and 3 enabled devices including those manufactured by Canon, HP, Konica, Lexmark, Ricoh, Samsung, Sharp and Xerox.

Print Tracker continues to offer language and performance enhancements in its English, Spanish, Portuguese and Japanese versions. Reported information is formatted in a manner suited for the country where it is installed.

A few of the improvements to the data gathering software Print Tracker Pro included augmenting data capture to improve accuracy on machines that report low supply levels and adding average fill numbers for a wider array of devices.

Print Tracker also enhanced its impressive list of management tools. The Total Cost of Ownership Estimator boasts a world-wide device list; clients can create customer invoices from gathered data; administrators can setup USB thumb drives containing Print Tracker installation files and helpful white papers; and more information is now returned as a result of remote requests for new IP address searches. In addition, SAP Business One users can create Service Calls as a result of received alerts, and e-automate users can have gathered scan counters provide an additional revenue stream.

Print Tracker also enhanced their server communications capability in 2014 and the company now offers unparalleled expansion for its customers. Dealers no longer need to consider software that promotes the need or expense of setting up and maintaining their own servers for data storage.

It has been a busy time at Print Tracker. To learn how Print Tracker can help you, please contact:
